

ABSTRACT OF THE DISCLOSURE

A liquid ornament with time-related device, is basically formed by combining a time-related main body and a main casing. The shape of the main casing can be like the traditional shape of a tumbler (an easily
5 tipped toy that quickly rights itself). The main casing at least comprises a secondary casing and a liquid ornamental casing. The liquid ornamental casing can be mounted on the top of the secondary casing, mounted below the bottom of the secondary casing, or at an appropriate position on the secondary casing. The main purpose of the present invention is to
10 let the time-related device with liquid ornament shake like a tumbler, so that the liquid and the decorative structure inside the liquid ornamental casing can perform a rocking effect.
